

IBC Project Report 3

Ghanendra Singh MT19213

Two weeks work Progress (12-04-21 - 28-04-21)

Defining Transient map

Continuing from the last programming progress report in which it was mentioned that there were some issues in defining the transient map which is used for private data storage, I was able to debug it and define the transient map properly.

Initialize a gene

- `gene1 = '{"id":12,"name":"Dennis","population":"American","gene":"APO1","size":320,"age":27,"variant":"APO3","price":91}'`
- `tmap = {'gene':gene1.encode()}`

Installing CouchDB at each peer

First, installed couchdb containers at each peer to be able to use them as state databases and able to access from the chaincode with the help of shim APIs. Developed understanding of docker compose [Get started with Docker Compose](#) to know how multiple containers interact with each other to integrate CouchDB with each peer as its the backend containerization technology in Fabric Network.

Couchdb Installation for each peer

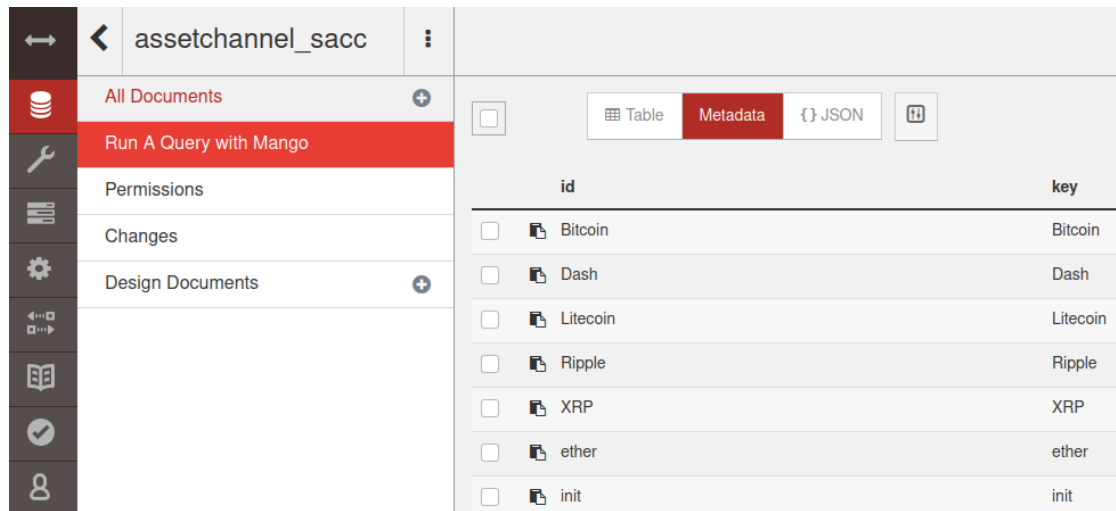

```
ghanendra@ghanendra:~/fabric-sdk-py$ docker-compose
ose-2orgs-4peers-tls.yaml up
Building with native build. Learn about native build
cs.docker.com/go/compose-native-build/
Creating network "fixtures_default" with the default
Creating couchdb1_p1_Org1      ... done
Creating couchdb0_p0_Org1      ... done
Creating couchdb3_p1_Org2      ... done
Creating orderer.example.com   ... done
Creating couchdb2_p0_Org2      ... done
Creating peer1.org2.example.com ... done
Creating peer0.org2.example.com ... done
Creating peer1.org1.example.com ... done
Creating peer0.org1.example.com ... done
```

Creating Smart Contract

Second, to begin with defining smart contracts or called as chaincode in Hyperledger Fabric framework, initially executed [example_cc](#) chaincode Invoke (used to perform operations using transactions) functions - invoke, delete and query. And then tested marble_cc.

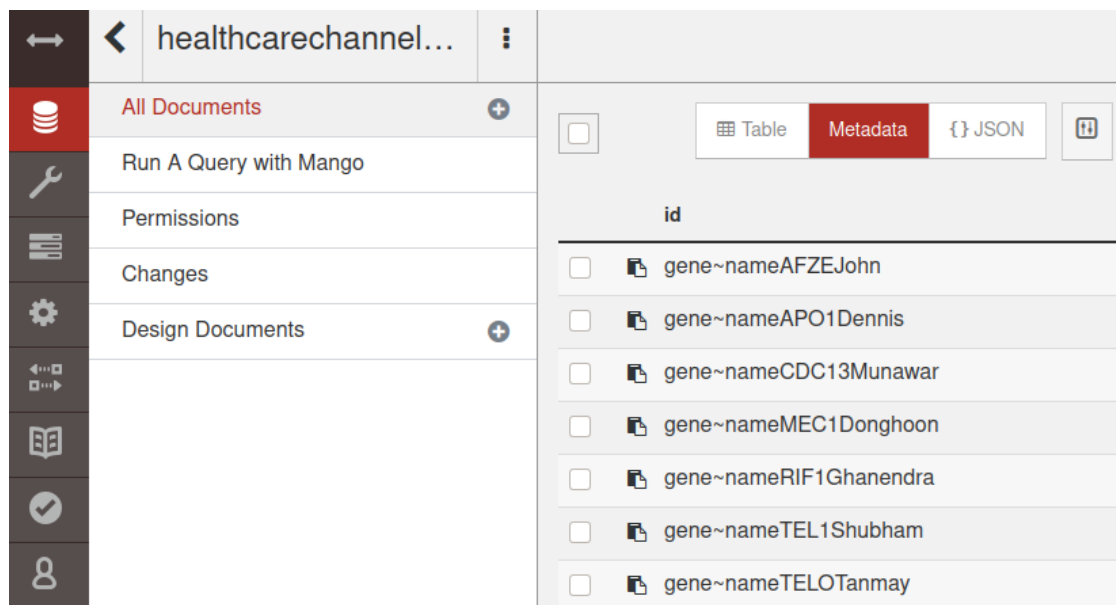

- Started from scratch and wrote a **simple assets** chaincode [sacc_go](#) to manage assets. Utilized given understanding from [Chaincode for Developers — hyperledger-fabric](#)
- Develop understanding of the [asset transfer Ledger Chaincode](#) which demonstrates use of CouchDB queries from chaincode. Then utilized [marbles_cc_private](#) chaincode as the base for creating **genomic_cc chaincode**.
- Link for few sample smart contracts - [Chaincode](#)

Simple Assets example

id	key
<input type="checkbox"/> Bitcoin	Bitcoin
<input type="checkbox"/> Dash	Dash
<input type="checkbox"/> Litecoin	Litecoin
<input type="checkbox"/> Ripple	Ripple
<input type="checkbox"/> XRP	XRP
<input type="checkbox"/> ether	ether
<input type="checkbox"/> init	init

Genomic_cc chaincode

id	key
<input type="checkbox"/> gene~nameAFZEJohn	gene~nameAFZEJohn
<input type="checkbox"/> gene~nameAPO1Dennis	gene~nameAPO1Dennis
<input type="checkbox"/> gene~nameCDC13Munawar	gene~nameCDC13Munawar
<input type="checkbox"/> gene~nameMEC1Donghoon	gene~nameMEC1Donghoon
<input type="checkbox"/> gene~nameRIF1Ghanendra	gene~nameRIF1Ghanendra
<input type="checkbox"/> gene~nameTEL1Shubham	gene~nameTEL1Shubham
<input type="checkbox"/> gene~nameTELOTanmay	gene~nameTELOTanmay
